

Model or platform used: Grok is the first AI platform to be used, with HTML to start at the base of the website. The base of the website means a word to represent “me.” After Grok, GitHub Copilot is used in the Visual Code Studio for processing CSS programs like cutscene and neon style.

Current website structure: The website is easy to use and user-friendly. At the top of the bar, while visitors click “Hin.” And “Hin’s Website” button, the website will go back to the top. Each time a different button is pressed, it redirects to a different self-introduction. The only difference is the music button, which takes you to a second page that introduces the music I've shared. Throughout the website, numerous images and texts feature various hyperlinks, along with videos and even music, providing more information and adding visual appeal. The music page even includes a play bar, allowing visitors to instantly play music.

Vibe coding process: During the Vibe coding process, I didn't encounter too many obstacles because I clearly and thoroughly specified my requirements before issuing each instruction (e.g., Specify the steps required to complete a task and provide examples), moreover, I didn't input too many different instructions at the same time (e.g., Ask the AI to process hyperlinks and insert images simultaneously.), reducing the problem of the AI making incorrect judgments during processing.

What you learned: I learned how to accurately guide AI to execute my commands. There were two unexpected results, but the results I received were pleasant surprises. They taught me that occasional mistakes can also be a form of growth.

Future plans: I will consider designing a mobile version of the website or launching a mobile UI.
